

Practical lesson

Our goal is to build Grocery Application
with several features

Grocery Application

Item

Submit

Steps to do

- Install project, preparing environment
- Create Interface:
 - Input for adding information
 - list with the buttons of edit and delete
 - button for clearing all items from the list

States for information

- State for the input value
- State for list of the items
- State for edit the item
- State for getting id of item for editing it
- State for hiding and showing alert

The **preventDefault()** method of the Event interface tells the user agent that if the event **does not get explicitly handled**, its default action should not be taken as it **normally would be**.

The global **setTimeout()** method sets a timer which executes a function or specified piece of code once the timer expires.

The global **clearTimeout()** method cancels a timeout previously established by calling **setTimeout()**.

React Icons

<https://react-icons.github.io/react-icons>

Package for IDs

<https://www.npmjs.com/package/uuid>

Final Project

- Left: Blog Post preview cards
- Right: Google Map with markers at the positions of the blog posts

- World Map with Google Maps API
- Research for a method to integrate the Google Maps API into a React-Component to display a world map.
- For each blog post, put a marker on the map at the location of the post.
- Initially the map gets centered by the newest blog post entry.

Display Blog Posts at Location

- Make the markers clickable: on click, show the short preview of the blog post in the "InfoWindow".
- It contains:
 - title
 - visiting date
 - authors image and name (can be hardcoded)
 - Place a link, which links to the detail page: /post/:id
 - The InfoWindow can be closed by clicking on the "x" (which is placed at right-top in the InfoWindow)

Blog Posts

- Blog Post Previews
- On the left all blog posts are listed as previews.
- The blogs are ordered ascending by visiting date.
- Each preview contains:
 - title
 - visiting date
 - authors image + name (can be hardcoded)
 - image
 - When user clicks on one of the listed blog post than she gets linked to the detail page /post/:id
